

Metrics-Based Research Assessment

Henk F. Moed

**Senior Scientific Advisor, Elsevier, Netherlands
Former professor of Research Assessment Methodologies,
Leiden University**

Vilnius, Lithuania, 19 March 2014

Short CV Henk F. Moed

Years	Position
1981-2009	Staff member at Centre for Science and Technology Studies (CWTS), Leiden Univ.
2009	Professor of Research Assessment Methodologies at Leiden University
2010 – Sept 2012	Elsevier , SciVal Dept. Senior Scientific Advisor
As from Sept 2012	Elsevier, AGRM Dept. Head of Informetric Research Group
As from July 2014	Elsevier (2 days/week) and visiting professor at academic institutions

Valuable notions and distinctions

- Data **accuracy** is crucial
- Use data **verified** by authors themselves
- **Combine** metrics and expert knowledge
- Impact factors are **no** substitutes of actual impact
- Use **multiple** indicators
- Take into account **pros and cons** of each indicator
- Take into account researchers' **career phase**
- Take into account **unintended** effects

1.

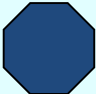

**Journal metrics are manipulable
and should account for
'free' citations and
editorial self-citations**

Base journal metric

Citations to all docs

Citable docs

Citable vs. non-citable docs

Citable documents	“non-citable” documents
	
Articles	Letters
Reviews	Editorials
	Discussion papers

The problem of “free” citations - 1

The problem of “free” citations - 2

Effects of editorial self-citations upon journal impact factors

[Reedijk & Moed, J. Doc., 2008]

- **Editorial self-citations:** A journal editor cites in his editorials papers published in his **own** journal
- Focus on '**consequences**' rather than 'motives'

Case: ISI/JCR Impact Factor of a Gerontology Journal

(published in the journal itself)

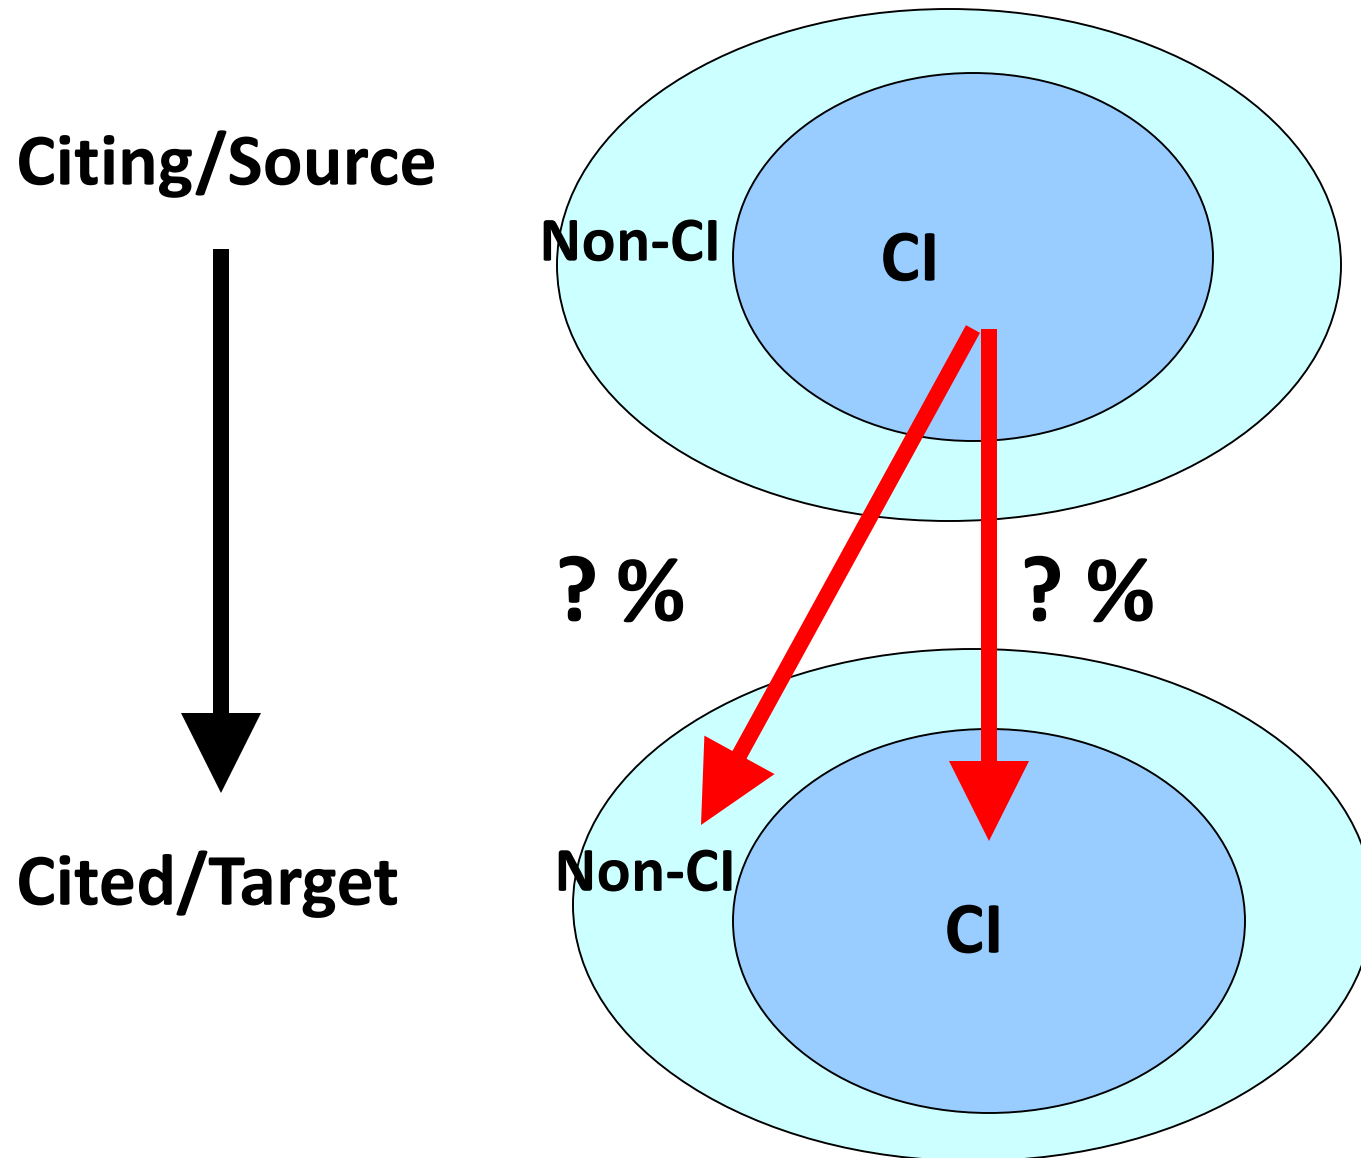

Decomposition of the IF of a Gerontology journal

2.

**Differences exist in
database coverage
between subject fields**

Coverage of journal-based citation index (CI)

Science

Citing/Source

Cited/Target

Humanities

Citing/Source

Cited/Target

CI coverage by field

Journals

Books,
proceedings

<u>EXCELLENT</u> (>80%)	<u>GOOD</u> (60-80%)	<u>FAIR</u> (40-60%)	<u>MODERATE</u> (<40%)
Biochem & Mol Biol	Appl Phys & Chem	Mathematics	Other Soc Sci
Biol Sci – Humans	Biol Sci – Anim & Plants	Economics	Humanities & Arts
Chemistry	Psychol & Psychiat	Engineering	
Clin Medicine	Geosciences		
Phys & Astron	Soc Sci ~ Medicine		

3.

**There are alternatives to the
journal impact factor:**

SNIP; SJR

Differences in citation potential between fields

Molecular Biology

Mathematics

SNIP (source-normalized impact per paper)

A journal's raw impact per paper

peer
reviewed
papers only

Citation potential in its subject field

A field's
frequency &
immediacy of
citation

Database
coverage

Journal
scope,
focus

Measured
relative to
database
median

Example 1 : Molec Biol vs. Mathematics

<i>Journal</i>	<i>RIP</i>	<i>Cit Pot</i>	<u><i>SNIP</i></u> <u>(= <i>JIF</i> /</u> <u><i>Cit Pot</i>)</u>
INVENT MATH	1.5	0.4	<u>3.8</u>
MOLEC CELL	13.0	3.2	<u>4.0</u>

4.

One must be cautious using
“**social benefit**” as an assessment criterion
of basic research, as it can **not** be
measured in a **politically neutral** way

5.

**Citations measure scientific-scholarly
impact rather than quality or validity**

6.

**Citation counts in social sciences
and humanities may be influenced
by political ideologies**

Citation impact and ideology

7.

**Case study on funding policies of a
National Research Council reveals:
biases in peer review**

Affinity Applicants – Evaluation Committee

- 0** Applicants are/were **not** member of **any** Committee
- 1** **Co**-applicant is/was member of a Committee, but **not** of the one evaluating
- 2** **First** applicant is/was member of a Committee, but **not** of the one evaluating
- 3** **Co**-applicant is member of the Committee(s) evaluating the proposal
- 4** **First** applicant is member of the Committee(s) evaluating the proposal

For 15 % of SUBMITTED applications an applicant is a member of the evaluating Committee (Affinity=3, 4)

Probability to be granted increases with increasing affinity applicants-Committee

Logistic regression analysis:
**Affinity Applicant-Committee has a significant effect
upon the probability to be granted**

MAXIMUM-LIKELIHOOD ANALYSIS-OF-VARIANCE TABLE (N=2,499)

Source	DF	Chi-Square	Prob

INTERCEPT	1	18.47	0.0000
<u>CITATION IMPACT APPLICANT</u>	<u>3</u>	<u>26.97</u>	<u>0.0000 **</u>
Rel transdisc impact applicant	1	0.29	0.5926
<u>AFFINITY APPLICANT-COMMITTEE</u>	<u>2</u>	<u>112.50</u>	<u>0.0000 **</u>
Sum requested	1	45.47	0.0000 **
Institution applicant	4	25.94	0.0000 **
LIKELIHOOD RATIO	199	230.23	0.0638

8.

**The future of research assessment
lies in the
intelligent combination of
metrics and peer review**

9.

Data must be accurate and verifiable

The Multi-Dimensional Research Assessment Matrix

**Expert Group on the Assessment of
University-Based Research (AUBR, 2010)**

Multi-dimensional Research Assessment Matrix (Part)

Unit of assessment	Purpose	Output dimensions	Bibliometric indicators	Other indicators
Individual	Allocate resources	Research productivity	Publications	Peer review
Research group	Improve performance	Quality, scholarly impact	Journal citation impact	Patents, licences, spin offs
Department	Increase multi-discipl. research	Innovation and social benefit	Actual citation impact	Invitations for conferences
Institution	Increase regional engagement	Sustainability & Scale	Internat. co-authorship	External research income
Research field	Promotion, hiring	Research infrastruct.	citation 'prestige'	PhD completion rates

Multi-dimensional Research Assessment Matrix (Part)

Unit of assessment	Purpose	Output dimensions	Bibliometric indicators	Other indicators
Individual	Allocate resources	Research products	Publications	Peer review
Research group	Improve performance	Quality, scholarly impact		en, nc, n o
Department	Increase multi-discipl. research	Innovat, soc benefit		itations, fer, ces
Institution	Increase regional engagement	Sustain, & Soc		err, ear, ome
Research field	Promotion, hiring	Research infrastruct.	'prestige'	D com-pletion rates

**Read
column-
wise**

Multi-dimensional Research Assessment Matrix (Part)

Unit of assessment	Purpose	Output dimensions	Bibliometric indicators	Other indicators
Individual	Allocate resources	Research productivity	Publications	Peer review
Research group	Improve performance	Quality, scholarly impact	Journal citation impact	Patents, licences, spin offs
Department	Increase multi-discipl. research	Innovation and social benefit	Actual citation impact	Invitations for conferences
Institution	Increase regional engagement	Sustainability & Scale	Internat. co-authorship	External research income
Research field	Promotion, hiring	Research infrastruct.	citation 'prestige'	PhD completion rates

**Indicators that are appropriate in one context
may be useless or invalid in another**

The choice of indicators depends upon:

- **What units are to be assessed**
- **Which aspect is being assessed?**
- **Why is the assessment done?**
- **“Meta” assumptions on the state of the system under assessment**

Illustration:

Three cases

CASE 1 [My view: non-defensible use]

**Meta level :
Policy issue**

Policy measure

**Bibliometric
operationali-
zation**

**Recruitment of new researchers at
research universities**

Select the best researchers

**Rank researchers by average
impact factor of journals in which
they published and select nr. 1**

CASE 2 [My view: defensible use]

**Meta level :
Policy issue**

Policy measure

**Bibliometric
operationali-
zation**

**Research community is not
sufficiently oriented toward
international networks**

**Stimulate publication in good
international journals**

**Count and reward articles in the
first impact quartile of journals in
subject field**

CASE 3 [My view: Defensible use]

**Meta level :
Policy issue**

Policy measure

**Bibliometric
operationali-
zation**

Professors are legally bound to do research but many of them are not research active

Allow only research active professors to decide on recruitment of new research staff

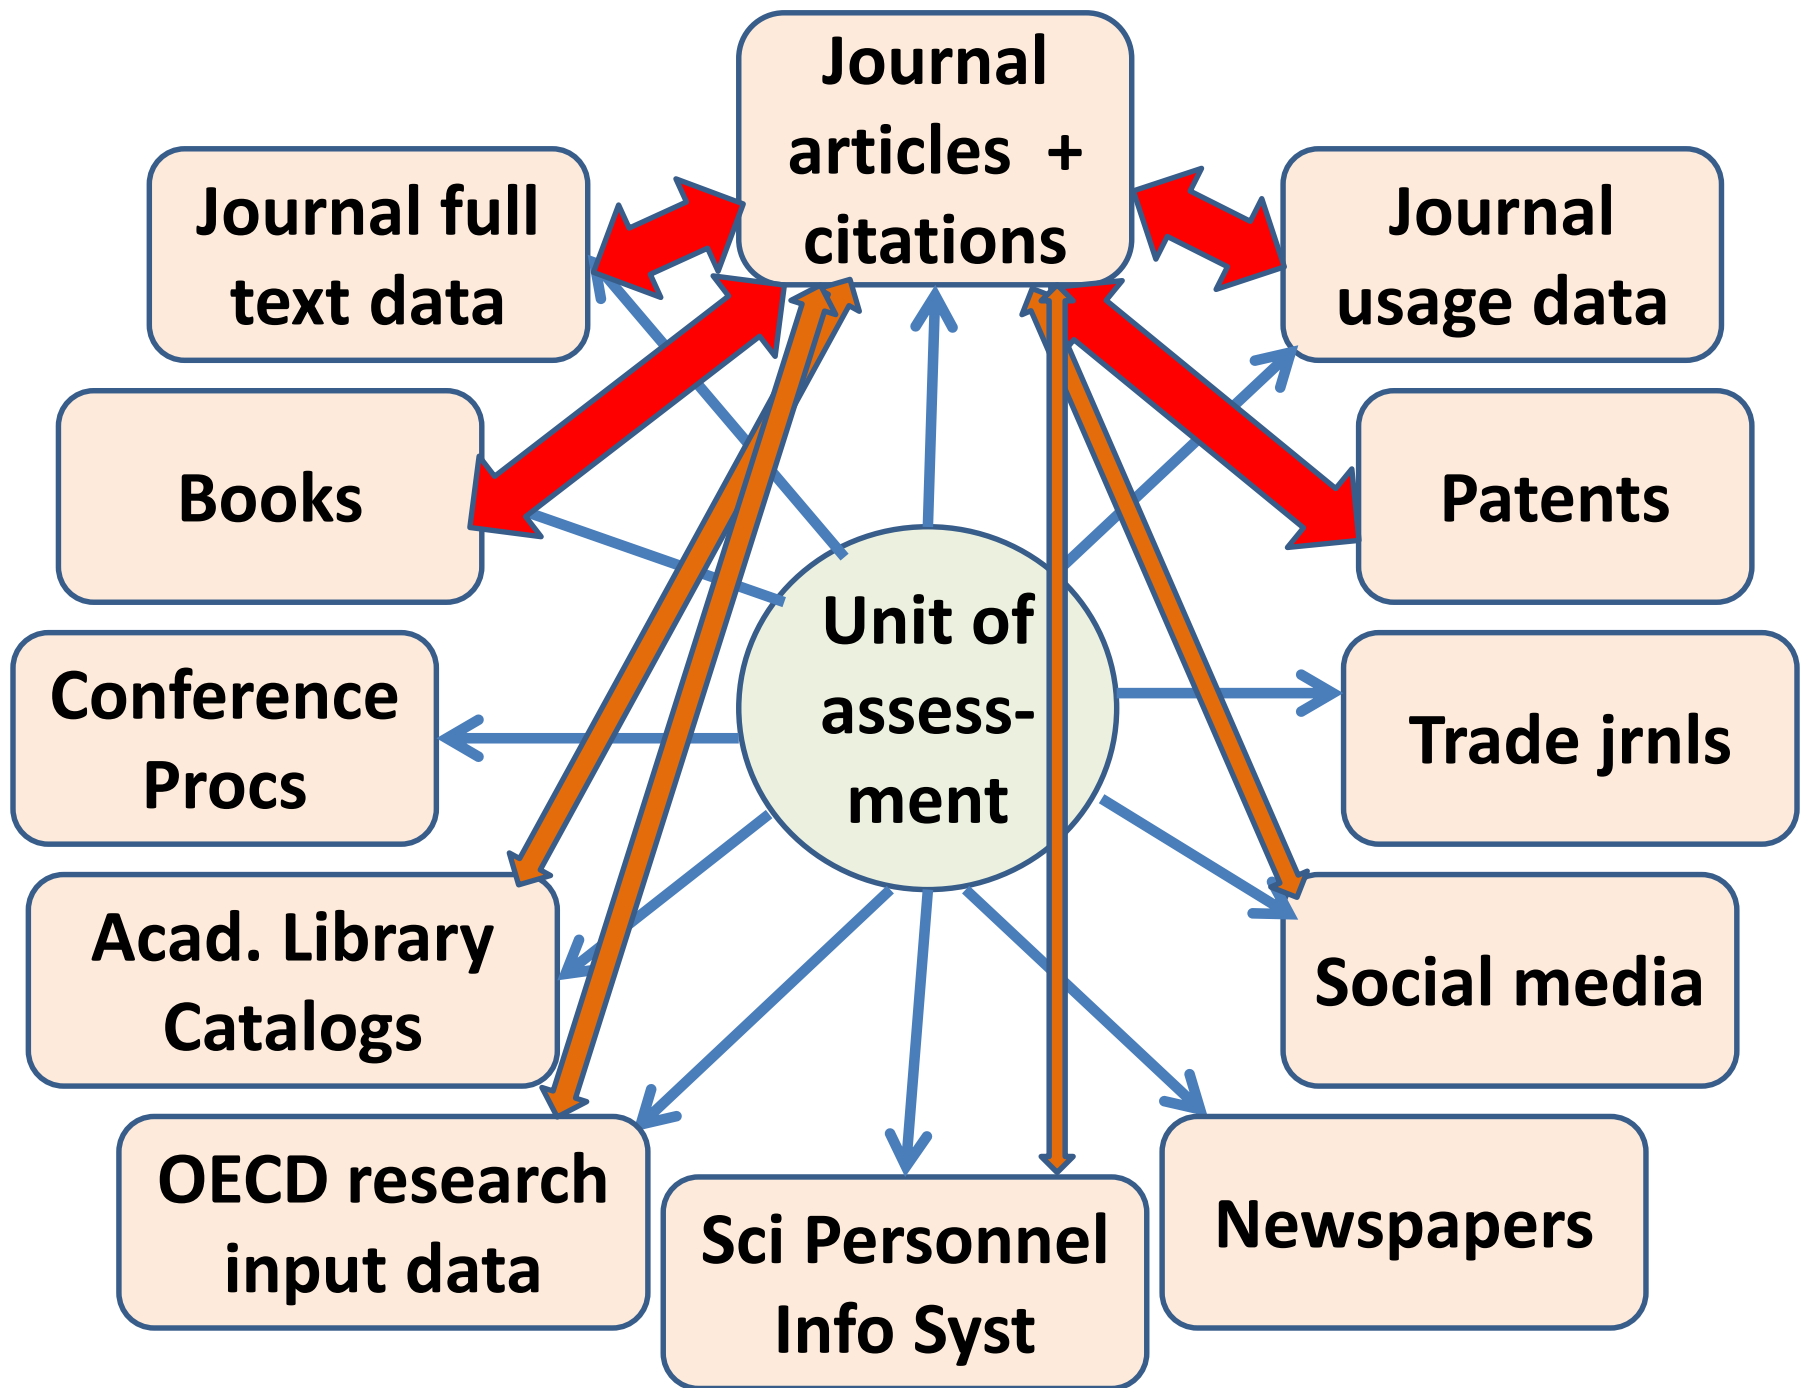

Select only professors with ≥ 3 publications in 7 years in recruitment committees

Wider issues

- **Change** an assessment method every **5-10** years?
- Focus on **top** or on **bottom** of quality distribution?
- What is an acceptable **“error rate”**?
- Wrong in **individual** cases \Leftrightarrow beneficiary for the system **as a whole**

| 2 | Multi-dimensional Research Assessment |
| 3 | Informetrics as Big Data Science |

(i)

Downloads vs. Citations

What do full article downloads measure?

Analogy Model

<u><i>Formal use</i></u>	<u><i>Informal use</i></u>
(Collections of) publishing authors	(Collections of) users
Citing a document	Downloading the full text of a document
Article	User session
Author's institutional affiliation	User's account name
Number of times cited	Number of times down-loaded as full text

Authors vs. readers

Hypothesis on correlation between downloads and citations

Authors

Strong

Authors

Readers

Weak

In Materials Chem downloads predict citations to journals, but in Management they do less so

Usage vs. citations per main field

(ii)

Patent citations to journal articles:

**The technological impact of research
(G. Halevi et al, 2012)**

The Technological Impact of Library Science Research: A Patent Analysis [Halevi et al, 2012]

PATENTS (TotalPatent)

**Citations by patent
examiners and inventors**

**42 LIBRARY SCIENCE
JOURNALS (Scopus)**

Articles Key Words

The articles feature information retrieval and indexing, information and documents management systems which pertain to electronic and digital libraries development

Patents Titles Key Words

The patents focus on electronic information administration, navigation, and products and services management in commercial systems.

(iii)

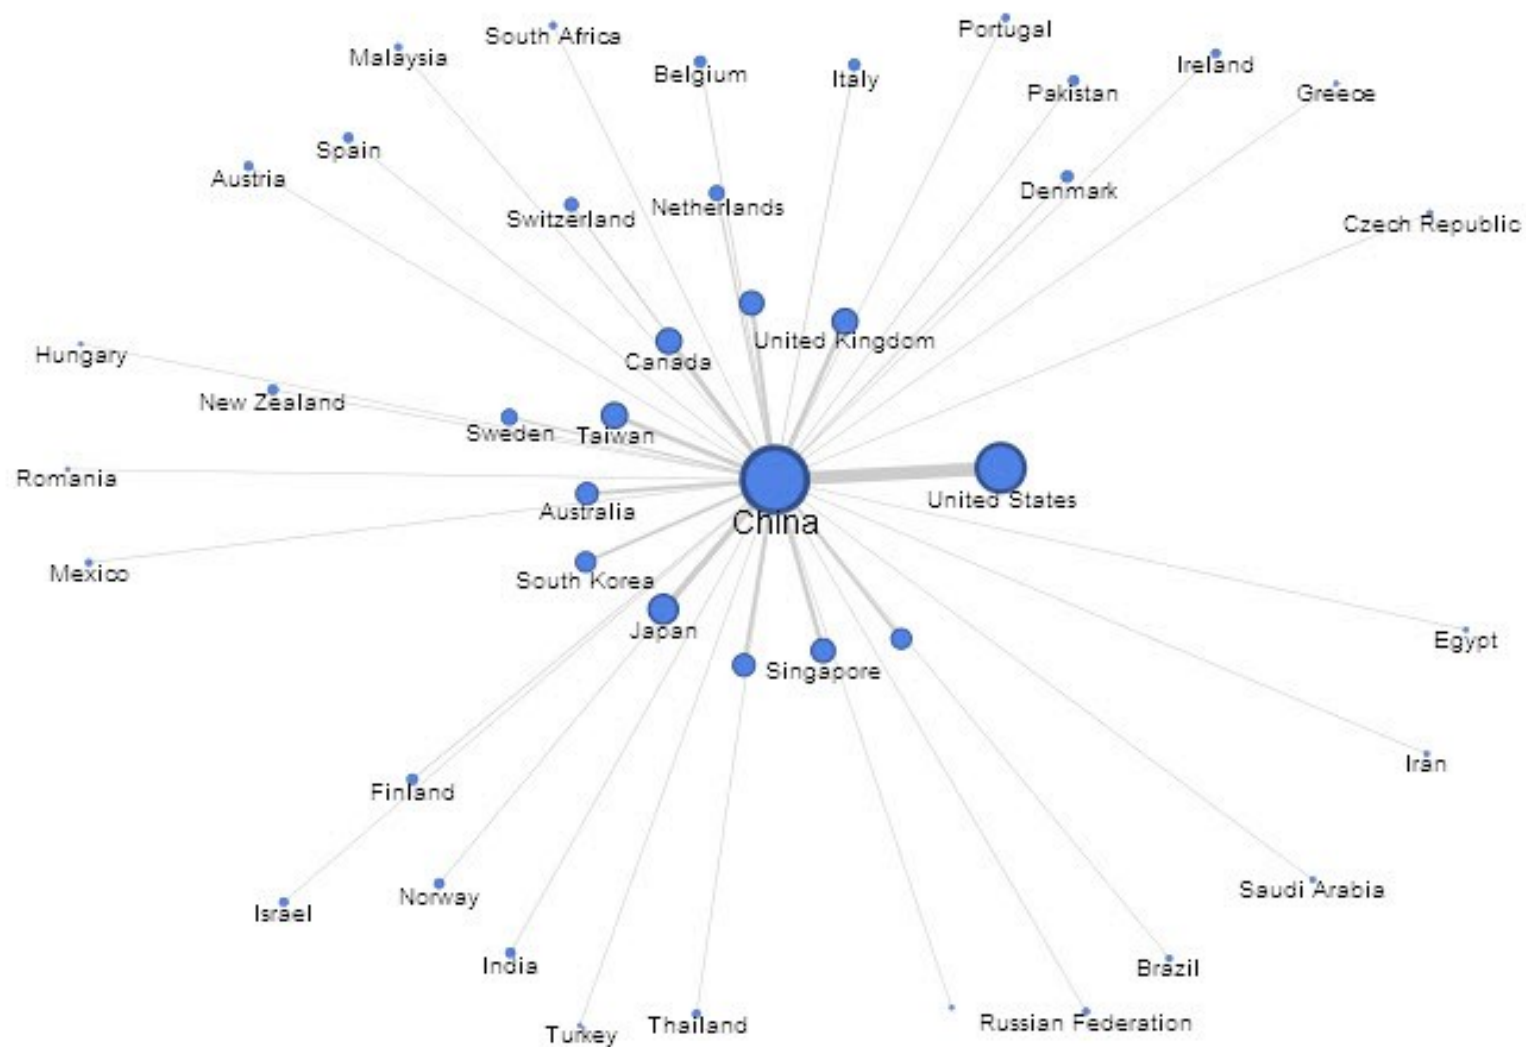

**Publication vs. survey data;
Scientific migration**

**Scopus author data vs.
OECD “input” statistics**

International migration vs. co-authorship

Relationship	Definition	Comment
International co-authorship	Authors from institutions located in different countries jointly publish a paper	Country relates to where authors work, NOT to their nationality
International migration	A scientific author moves from one country to another	

Migration to China

(iv)

**The use of contextual citations analysis
to disclose the thematic and conceptual
flow of cross- disciplinary research:**

the case of the Journal of Informetrics

2007 (Gali Halevi et al., 2013)

Out Discipline themes within the Findings & Discussion

clouds below might suggest that the individual output evaluation done by structured peer review leads to an acknowledgment of the importance and evolution of networks rather than individuals

Out-Discipline Themes in the Conclusions Section
